JEB BUSH
Governor

TONI JENNINGS
Lieutenant Governor

FOYT RALSTON
Florida Acting Chief
Information Officer

REVISION MEMORANDUM

TO: RECIPIENTS OF THE FLORIDA EMERGENCY MEDICAL SERVICES
(EMS) COMMUNICATIONS PLAN

FROM: JOHN FORD, CHIEF SYSTEMS OFFICER
ENTERPRISE SERVICES
STATE TECHNOLOGY OFFICE

DATE: APRIL 2004

SUBJECT: APRIL 2004 EDITION OF VOLUME II OF THE EMS
COMMUNICATIONS PLAN

Enclosed is the April 2004 edition of the EMS Communications Plan, Volume II. This Plan is also available for download from our web site at:

<http://www9.myflorida.com/workforce/ems1/Telecom/comhome.html>

Limited quantities of hard copies have been distributed for permitted vehicles. To update the set in your office, hospital emergency room, or other locations, copy a current edition, download it from our web site, or call us for additional copies.

This edition has been prepared to reflect a few changes. First, Foyt Ralston is now the Florida Acting Chief Information Officer of the State Technology Office. Second, I am the acting Executive Manager of Enterprise Services. The data throughout Section 3.0 has been updated to reflect information obtained from the State EMS Office and the communications representative of each county. The number of permitted vehicles has been deleted from Section 3.0 of the Plan. County Dispatch frequency information and all 800 MHz frequency used for EMS communications have also been deleted from this section. County Medical Channels have been added along with Hospital Emergency Departments channel assignments to the tables shown in Section 3.0.

If you have any questions or comments, please call our EMS Engineering group at (850) 922-6437 (SUNCOM 292-6437) or (850) 922-7424 (SUNCOM 292-7424). Thank you for your cooperation.

1 INTRODUCTION

1.1 PURPOSE

Volume II of this Emergency Medical Services Communications Plan has been developed by the State of Florida State Technology Office, primarily as an operational “field manual” to be carried as standard equipment on all permitted vehicles within the State. It is designed to contain information useful for day-to-day operations, as well as to provide the data necessary to enable radio communications during transport operations in unfamiliar areas, including adjacent counties in Georgia and Alabama.

Volume II is also intended to be used for instructional purposes in training programs for Emergency Medical Technicians and Paramedics, through its operational approach and explanatory section regarding radio frequency communications.

The State Technology Office invites suggestions regarding the contents of both this Volume, as well as Volume I, as to any ways in which the EMS Communications Plan may be made more accurate and useful. The Program may be reached by telephone at (850) 922-6437, SUNCOM 292-6437, or by mail to:

State of Florida
State Technology Office
Building 4030
Tallahassee, Florida 32399-0950

1.2 Summary

Section 2.0 “OPERATIONS” contains requirements of the Federal Communications Commission (FCC) Rules relating to communications operations, information on standard operating practices, basic radio theory, and discussion of the various radio frequency bands. It also contains an explanation of a primary source of interference, which can disrupt normal communications, as well as a definition of the concepts involved in EMS communications.

Section 3.0 “FLORIDA EMS ALLOCATIONS” contains an alphabetical listing by County of all radio frequencies for EMS operations within the State, as well as Hospital Emergency Department addresses & telephone information. Radio dial codes are shown for those counties using selective addressing for radio communications with hospitals. The city/town and telephone number of each ground and air ambulance provider is listed, showing the quantity of permitted vehicles licensed to each. The air ambulance providers are listed again separately, showing additional information.

Section 4.0 “INTERSTATE ALLOCATIONS” gives a general description of the EMS communications systems in adjacent counties of both Georgia and Alabama, as well as the address, telephone, radio frequency, and selective address dial code of each hospital in those counties.

Section 5.0 “HOSPITAL LATITUDE/LONGITUDE COORDINATES” gives a listing of general latitude/longitude coordinates as provided by the EMS providers.

Section 6.0 “WIDE AREA STATEWIDE INTERSEVICE/MUTUAL AID FREQUENCIES” lists the channel usage, eligibility, and primary usage of wide-area and statewide mutual-aid frequencies available for utilization in Florida.

2 OPERATIONAL INFORMATION

2.1 FCC Rules & Regulations

The Federal Communications Commission (FCC) prescribes a framework of rules to govern the transmission of radio signals. Under these rules, each user of the radio spectrum must be eligible to operate on given frequencies and be authorized to do so. The Rules are organized into various Parts and Sub-parts, which address the FCC's practice and procedures, including frequency assignment policy and operating requirements. Public Safety communications is governed by Part 90 of the FCC Rules.

2.1.1 General Requirements

Licensees of radio systems have direct responsibility for the proper operation of each transmitter licensed. They must ensure that radios are used in accordance with the Rules and for purposes directly related to the particular activities for which they are licensed. Priority is to be given to communications involving the imminent safety of life and property, but licensees are required to keep transmission times to a minimum and employ efficient operating procedures to maximize the utilization of the frequency spectrum.

Licensees are required to take reasonable precautions to avoid causing harmful interference to other radio users. This includes monitoring the operating frequency for communications in progress and such other measures as may be necessary to minimize the potential for causing interference.

2.1.2 Operation Requirements

No operator license or permit is required for the individual personnel operating radio equipment. Any person having the consent of the system licensee may provide authorized communications on behalf of the licensee. The licensee will at all times exercise responsibility for operations and is expected to provide observation, servicing and maintenance as often as necessary to ensure compliance with all applicable rules.

2.2 Operating Practices

In the course of providing emergency health care to the public, many of the individual participants practicing in the EMS system are required to communicate with one another via two-way radio facilities. Good operator practice is essential to the effectiveness and efficiency of any public safety communications system. For EMS, good practice followed by EMTs/Paramedics, dispatchers, physicians and emergency department nursing personnel relates directly to a reduction in response time which in turn saves lives, reduces further injuries and minimizes suffering.

2.2.1 Equipment Familiarization

A first step in proper communications techniques is necessarily a familiarization with the radio equipment to be used by the operator. There are many different brands and types of radio equipment items that EMS personnel will encounter in their work, and manufacturers are continually introducing new products that will always present new educational challenges. As a minimum, communications systems are comprised of mobile and/or portable radios, base/repeater stations and various radio-controlled devices. Additionally, they may include more complex aspects such as telemetry, satellite receiver voting systems, vehicular repeaters, trunked operations and data.

EMS personnel should take sufficient time to learn the correct operation of each item of communications equipment that they use. They should fully investigate the various features of that equipment in order to maximize the extent to which the equipment assists in delivery of emergency services. Operators are encouraged to ask questions of their colleagues, equipment maintenance technicians and manufacturers' representatives to ensure understanding.

2.2.2 Communications Skills

The objective of radio communications in EMS is to convey information in a concise and accurate manner. The communications skills exhibited by operator personnel can have a positive influence on the outcome of a particular event.

A. Operating Protocol

In most EMS services there is generally some agreed-upon protocol (written or unwritten) to govern radio communications. If unwritten, such procedures are probably defined by tradition. No attempt is made here to establish a particular mode of operation, however, certain key points are highlighted for the benefit of operator personnel.

- Follow standard protocol established by the EMS service. It may address the manner in which calls are to be placed from one unit of the service to another, and govern the manner in which messages are formatted.
- Maintain channel discipline. Courtesy and respect for the communications of others sharing the radio channel go a long way in preserving order, especially in congested geographic areas with much radio traffic. Monitor the channel before transmitting to prevent interference to others users. Think ahead and keep transmissions short and to the point to maximize airtime.
- Practice verbal communications skills. Speak distinctly, at a moderate rate, and directly into the microphone or handset to maximize intelligibility. Keeping the microphone close to the mouth overcomes background noise and permits the operator to speak in a normal tone of voice. Shouting is to be avoided as it results in audio distortion and thus works against the premise of intelligibility.

- Use plain language to describe a particular condition or event when in doubt of the appropriate aural brevity code might otherwise be used. Individuals under stress may find it easier to relate clear and simple descriptions.

B. Technical Considerations

- Key your transmitter before engaging in speech. The complexities in communications system design often introduce delay in the time it takes to turn on the various components comprising the system. Transmitters take time to come up to full power output, tone squelch decoding equipment requires time to open receivers and receiver voting systems take time to select the best receiver. While these events generally are accomplished in less than one second, there are many voice transmissions that could be missed in their entirety if the operator did not delay slightly before beginning his/her voice message. Pausing one second after depressing the push-to-talk button on the microphone or headset is sufficient in most cases to prevent missed words or responses.
- Keep loudspeaker clear of clutter. Papers or other materials covering or obstructing loudspeakers can diminish receiver audio and alter intelligibility.
- Avoid turning receiver volume too low. A low setting may fail to attract the operator's attention to an incoming call.

2.3 Radio Theory

2.3.1 Radio Waves

A radio signal is an invisible wave of “electromagnetic” radiation that has the ability to move through space at 186,000 miles per second - the speed of light. It is non-ionizing radiation, which results when an alternating current of radio frequency is established in an antenna. The alternating current will produce an alternating electromagnetic field in the space surrounding the antenna that will propagate outward from the antenna with a continuous reduction in strength.

2.3.2 Alternating Current vs. Direct Current

The alternating electric and magnetic fields associated with radio waves are better realized with some understanding of electrical current. The most basic form of electricity is direct current, known as DC, which is that obtained most commonly from a battery. If both terminals of a battery are connected to some electric device or circuit, current will flow from the battery through the circuit. For example, if a light bulb were connected to a battery, current would flow through the light bulb and produce energy in the form of visible light. If the battery direct-current source was replaced with a source of alternating current (AC) such as a generator, the current in the light circuit would continually reverse its direction, or alternate, at a rate dependent on the rotating speed of the generator. The number of times per second that the current changes direction (cycles per second) is known as the **frequency** of the alternating current.

2.3.3 Radio Frequencies

Radio waves are produced by alternating currents that are of the same nature, but of much higher frequency than the 60 cycles per second frequency of normal AC power systems. A radio transmitter that is connected to an antenna to produce the radiated wave generates these currents. The waves thus produced by an antenna travel through space to a distant antenna that is connected to a radio receiver. The purpose of the radio signal is to carry information from a point of origin to one or more points of destination, hence the terms “carrier wave” or “carrier” which are often used to describe it. The information carried may be voice, music, video, telemetry, or other information.

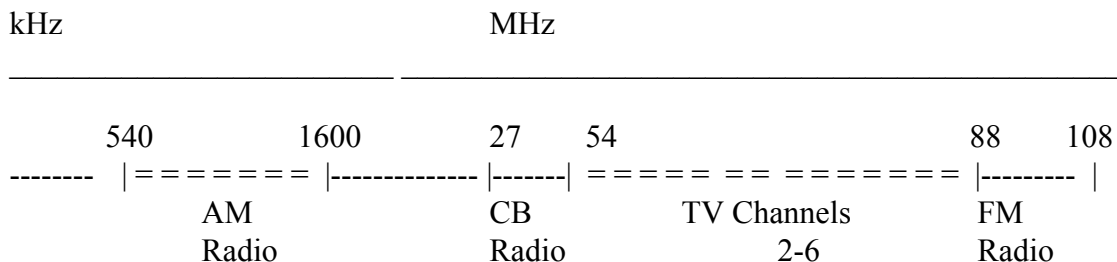

The ranges of frequencies, which may be used from radio communication, vary between approximately 30,000 Hz (Hertz) and 300,000,000,000 Hz. When dealing with such high frequencies it is more appropriate to use larger units to describe them. The terms commonly used are kilohertz, megahertz, and gigahertz, abbreviated kHz, MHz and GHz, respectively. The relationship between hertz, kilohertz, megahertz and gigahertz is as follows:

1 kHz = 1,000 Hz

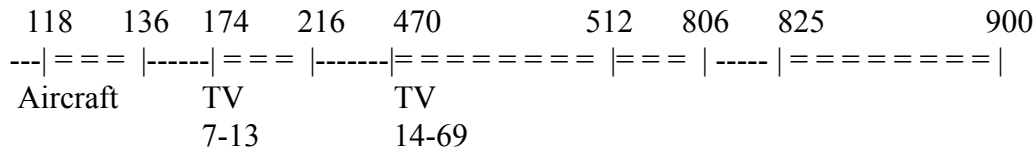

1 MHz = 1,000 kHz = 1,000,000 Hz

1 GHz = 1,000 MHz = 1,000,000 kHz = 1,000,000,000 Hz

To gain familiarity with frequency spectrum and its units of measurement, it is helpful to take as a first example the standard “AM” broadcast band. This radio band extends from 540 kHz to 1,600 kHz. A radio station found at 1,200 kHz on the radio dial could also be said to be operating at 1.2 MHz. The “FM” broadcast band is located much higher in the frequency spectrum than the AM band, and ranges between 88 and 108 MHz. In between the AM and FM broadcast bands (between 1.6 MHz and 88 MHz) operate many different communications services. Included in this range of spectrum are international (short-wave) broadcasts, military communications and ham radio, but most familiar are Citizens Band (CB) radio at 27 MHz and TV Channels 2 through 6 between 54 and 88 MHz. This portion of the spectrum is graphically portrayed as follows:

Services that operate above the FM broadcast band include aircraft (118 - 136 MHz), TV Channels 7 through 13 and 14 through 69 (174 - 216 MHz and 470 - 806 MHz, respectively), and cellular telephones (825 - 845 MHz mobile and 870 - 890 MHz base).

2.3.4 Land Mobile Radio Frequency Bands

The entire radio frequency spectrum is grouped into the following classifications of frequency range and band name:

30 - 300 kHz	Low Frequency (LF)
300 - 3,000 kHz	Medium Frequency (MF)
3 - 30 MHz	High Frequency (HF)
30 - 300 MHz	Very High Frequency (VHF)*
300 - 3,000 MHz	Ultra High Frequency (UHF)
3 - 30 GHz	Super High Frequency (SHF)
30 - 300 GHz	Extremely High Frequency (EHF)

*Within the VHF Band used by public safety radio services, the range 30 - 50 MHz is commonly referred to as “VHF Low Band”; the range 150 - 160 MHz is referred to as “VHF High Band”. Similarly, 800 MHz is identified separately in the UHF band.

In the spectrum between about 25 MHz and 1,000 MHz are various bands allocated by the FCC for two-way mobile radio communications known as “land mobile radio” bands.

They have the following common designations

25 – 50 MHz	VHF Low Band
150 – 174 MHz	VHF High Band
450 – 470 MHz	UHF Band
470 – 512 MHz	UHF TV Sharing (specific areas only)
806 – 824 MHz & 851 – 869 MHz	800 MHz Band

Each of these frequency “sub-bands” are widely used for two-way land mobile radio communications in the Public Safety Services. The choice as to which one is best for a particular operation depends on the frequency availability, the particular type of communications system required, the radio coverage area required, and many other engineering factors. Each frequency band has its unique properties that must be factored into the overall engineering of the system design for each user.

2.3.5 VHF Low Band

VHF Low Band has, as its advantage, the farthest coverage distance (other factors being equal) of any of the land mobile frequency bands. Given the same operating conditions (transmitter power and antenna height), low band will generally “talk” further, base-to-mobile and mobile-to-mobile. It is also better suited for traversing hilly terrain and penetrating heavily wooded areas than higher frequencies.

Unfortunately, VHF Low Band has several disadvantages not shared by higher frequencies. It is commonly affected by “skip” interference (which occurs when radio signals are reflected from the upper atmosphere at great distances from the location of origin). It is not uncommon to receive stations over 2,000 miles away, and such occurrences tend to disrupt local communications. VHF Low Band is also affected to more of an extent by man-made noise sources than higher frequencies. Automobile ignition systems, motors, commercial power lines and electric fences in the vicinity of radio receivers may create so much electrical noise that the desired radio signals may be masked at times to the point that they become unusable.

Additionally, and for some of the above reasons, VHF Low Band does not generally fare well in urban environments. In addition to the above shortcomings, antennas for VHF Low Band communications must be relatively large compared to higher frequency antennas; attempts to shorten these antennas for convenience or practically results in inefficiency and reduced coverage area.

2.3.6 VHF High Band

Within the 150 MHz range of VHF High Band, skip interference is considerably reduced. Man-made noise sources also are not of as much concern, and better penetration into metropolitan area environments is realized. Due to the shorter wavelength of VHF High Band, it becomes practical to use shorter antennas that exhibit greater gain than with similar lengths at VHF Low Band.

VHF High Band has typically been, for the above reasons, the band of choice for many applications. In many parts of the United States however, VHF High Band has become so congested, particularly in metropolitan areas, that interference of several kinds from neighboring systems is often received. Point-to-point co-channel interference is particularly severe in view of the simplex-type allocation of these frequencies by the FCC. VHF High Band is also characterized by a somewhat shorter communications range than VHF Low Band, especially on a mobile-to-mobile basis.

2.3.7 UHF Band

UHF Band communications are virtually free from skip interference and electrical noise when compared to lower bands. At 450 MHz, the radio waves are physically shorter than VHF Low Band or High Band such that they have an ability to easily reflect off of common hard surfaces. Thus, the UHF Band is often an excellent choice for penetrating into, and around, heavy building structures in urban areas.

As frequency is increased however, losses due to hills and foliage also increase. The UHF Band has more difficulty transmitting signals over hilly or irregular terrain than with lower bands. Hills tend to block the signal more severely and can significantly reduce range. Also, absorption of the signal by trees and other foliage is more prevalent at UHF and must be factored into any UHF system design. Since mobile-to-mobile range is significantly less than that accommodated by the lower frequency bands, repeater stations are commonly used to relay transmissions between mobile units.

2.3.8 800 MHz Band

The characteristics of the 800 MHz Band are very similar to the UHF Band except that the negative aspects are somewhat accentuated. With the proper engineering and design however, the 800 MHz Band can be a viable alternative to the lower frequencies.

Proprietary 800 MHz Trunked Radio Systems

EMS communications systems may migrate to specialized radio “trunked” systems that will shift EMS communications to a proprietary radio infrastructure. Radio systems that employ this technology will meet those agencies requirements for VDR and/or LMC communications. In that these systems are proprietary in nature they will not meet the requirements for MED-8 specified within this plan for emergency departments.

2.4 Radio Frequency Interference

The ability to communicate by radio may be significantly affected by other communications systems operating on the same or different frequencies. Most interference that occurs is unintentional and can be difficult to identify if it can be detected at all.

2.4.1 Co-Channel Interference

This type of interference is most readily identified and occurs from different radio systems sharing the same frequency. Ideally, systems are authorized with sufficient geographic distance between them such that one system does not hear the other system and visa-versa. On occasion, however, atmospheric conditions will support better than normal communications range and audible signals of the distant system are received. Depending on the strength of these “co-channel” signals, normal communications may be disrupted or precluded. Co-channel interference is sometimes referred to as “skip” interference when the interfering signal originates hundreds or even thousands of miles distant from the

affected receiver. This mechanism of radio transmission uses the upper atmosphere (ionosphere) to reflect a radio wave back to earth.

2.4.2 Receiver Desensitization

When using a radio receiver in the physical vicinity of a transmitter operating on a frequency close to that which the receiver is tuned (but not directly on it), the receiver's ability to "hear" weak on-channel signals is impaired. The effect may be to lose a desired transmission completely or it may appear to be partially "cut off".

2.4.3 Transmitter Noise

Transmitters are not perfect devices and will radiate some amount of noise in addition to the primary signal. This noise appears on either side of the transmitted and can interfere with nearby receivers tuned to other frequencies. The end result is similar to what is experienced with receiver desensitization, but the mechanism of interference is a masking of desired signals by the noisy transmitter.

2.4.4 Intermodulation Interference

Intermodulation interference, or "intermod", is caused when two or more radio signals of different frequencies combine to create yet other frequencies (a process known as mixing). If one of the new frequencies produced happens to occur on a desired receiver frequency, interference may result to desired signals. Such frequency mixing most frequently occurs either in a transmitter or in a receiver.

Transmitter-produced intermod occurs when strong radio signals are combined in the power amplifier of a transmitter, and the "mix frequencies" are re-radiated along with the intended signal. If one of the mix frequencies is heard in the affected receiver, it may be possible to detect the audio of the interfering signal as comprised of multiple voices in accordance with the number of transmitters participating in the mix.

Receiver-produced intermod manifests itself when two or more strong off-frequency signals combine in the receiver electronic circuitry to create still other frequencies through mixing. Like the transmitter-produced case, if one of the resultant frequencies is nearly the same as the frequency to which the receiver is tuned, the intermod signal will compete with the desired received signal.

Listening to the interfering signal can generally identify intermodulation interference, because it will usually be comprised of two or more voices and is likely to suddenly cease when one of the transmitters contributing to the mixing process is turned off. However, the process of identifying the participants so as to remedy the interference problem may not be so easy since they may be located at other radio sites and operate in different radio services. Additionally, intermod is not only known for being produced in transmitters and receivers. Other sites of production may include antennas, metallic flashing on rooftops, rusted or corroded mechanical joints of antenna towers, and on occasion, rusted automobile bodies or similar materials.

2.4.5 Equipment and Interference Rejection

While the occurrence of interference in the radio environment cannot be eliminated, it can often be controlled to the point where its harmful effects minimize the disruption of communications. For the public safety services, the purchase of communications equipment exhibiting quality in the design of interference rejection circuitry will do much for dealing with the problems of receiver desensitization, transmitter noise and intermodulation interference. Additionally, proper system engineering is required to provide for ancillary protective devices (such as radio frequency filters and isolators) where needed.

2.5 CONCEPTS OF EMS COMMUNICATIONS

2.5.1 General

An Emergency Medical Services Communications system must provide the means by which emergency medical resources can be accessed, mobilized, managed, and coordinated in both normal and adverse situations. An EMS communications system must therefore employ sufficient communications paths and operational capabilities among all participants to facilitate the functional EMS communications concepts described in the remainder of this section.

2.5.2 Citizen Access

The EMS communications system must have the ability to receive and process all incoming requests, which report emergencies and require emergency medical assistance. All individuals shall be able to summon help rapidly in an emergency situation whether for medical, police, fire, rescue, or other emergency needs. Local, statewide, and national uniformity is required to fully enable this concept.

The State of Florida 9-1-1 Emergency Telephone Number Plan has provided for a cohesive statewide emergency telephone number "9-1-1" system to provide citizens with this rapid direct access to public safety agencies. The 9-1-1 Plan was developed in response to the Florida Emergency Telephone Act of 1974.

2.5.3 Vehicle Dispatch and Response (VDR)

On notification of need for emergency medical assistance, the communications system shall enable prompt dispatch of all required EMS vehicles (including notification of rotor-wing aircraft) to the location of the emergency. The communications system must further enable dispatchers to communicate with responding vehicles while en route to the scene, while at the scene, while en route to hospital emergency department facilities, and during their return to availability for further assignment.

2.5.4 Crew Alerting

As a sub-concept to Vehicle Dispatch and Response, some EMS communications systems, as determined by local procedure, may require the direct alerting of EMS personnel either individually or in groups. This can be accomplished through the use of either monitor or paging receivers, or by means of two-way hand-held portable radios with a selective call capability. This concept is limited only to such alert paging required to facilitate the immediate response and action of personnel resulting from a request for emergency medical services.

2.5.5 Automatic Vehicle Location (AVL)

Use of Automatic Vehicle Location (AVL) systems provide real-time geographic location of vehicles to ensure the nearest available vehicle is dispatched to the scene of an incident. Additionally, an AVL system displays vehicle positions to dispatchers on either tabular and/or graphic displays as well as providing the information necessary to a Computer-Aided Dispatch (CAD) program when utilized in “System Status Management” structure. Consequently, these capabilities are considered an integral component of VDR.

2.5.6 Local Medical Coordination (LMC)

The EMS communications system shall provide EMS field personnel with a communications system and/or channel that permit the exchange of vital information between EMS field personnel, emergency departments and/or medical directors. Minimally, the LMC channel shall have the capability to provide communications capability to emergency department personnel with a five-minute notification while en route to an emergency department facility.

2.5.7 Countywide Medical Coordination (CMC)

In addition to VDR capability, the EMS communications system within a county should provide a secondary CMC communications channel to enable dispatch and response between EMS field personnel, hospital emergency departments and dispatch center personnel during isolated critical situations MCIs during which prolonged use of VDR channel would not be feasible due to normal and/or other VDR communications traffic. Such uses of CMC channel must be limited only to the temporary duration. This channel should provide communications while the units are at the scene of medical emergency.

2.5.8 Statewide Medical Coordination (SMC)

In addition to Local Medical Coordination (LMC) or CMC capability, the EMS communications system must provide a communications channel to enable medical coordination between EMS field personnel and emergency department personnel during situations in which a vehicle is out of its prime area and unable to access an emergency department using the LMC or CMC channel of that area, mutual-aid communications, and in isolated critical situations during which prolonged use of the LMC or CMC channel would not be feasible due to other LMC communications traffic. Such uses of the SMC channel must be limited only to the temporary duration of such situations. The channel specifically assigned for SMC is MED-8.

2.5.9 Statewide Scene or Local Scene Coordination (SSC or LSC)

The EMS communications system must have the capability for mobile and portable radios to communicate directly (unit-to-unit) while on the scene of an emergency requiring multiple vehicle response.

2.5.10 Medical Resource Coordination (MRC)

The EMS communications system must provide for point-to-point coordination of EMS resources between hospitals, providers, and communications control centers for response to a disaster or mass casualty incident. Telephone lines between communications control centers can be used for resource coordination during normal operations. However, radio communications are needed during situations following hurricanes, tornadoes, floods, fires, etc., when telephone lines are inoperative, or when telephone central office switching facilities are jammed or disable

3 FLORIDA EMS ALLOCATIONS

3.1 General

Preparation of the following tables of radio channel allocations and organizational data for EMS communications within Florida has been a major undertaking by the State Technology Office (Office) in the production of this Plan. The effort initially began in 1986 with a survey of all Counties, EMS Providers, and Hospitals in the State. The data collected has been incorporated into an automated database to be maintained over time with revisions to be issued, as they become necessary.

As with any database of this size, errors and omissions are bound to occur. The Office requests all organizations to review the data applicable to them, and to advise the Office as to any changes or additions. The Office further requests ideas as to ways in which the data may be made more useful or complete toward its purpose of providing the most current and applicable EMS communications information to organizations involved in the provision of emergency medical services within Florida.

3.2 Introduction to Tables

The following tables are organized alphabetically by County. Within each County is a listing of radio channel information, followed by information on Emergency Department facilities, and EMS Providers.

3.2.1 Radio Channel Information

Radio channel information is shown by channel use description, by continuous tone-controlled squelch (CTCSS) frequency (in Hertz), , and by base-transmit and base-receive frequency (in MHz or MED channel number).

A. MED Channel Frequencies

MED Channel numbers 1 through 103 are prescribed by FCC Rules, as corresponding to the following radio transmit frequencies in MHz:

MED CHANNEL	FREQUENCY (Base & Mobile)	FREQUENCY (Mobile Only)	MED CHANNEL	FREQUENCY (Base & Mobile)	FREQUENCY (Mobile Only)
1	463.000	468.000	6	463.125	468.125
11	463.00625		61	463.13125	
12	463.0125		62	463.1375	
13	463.01875		63	463.14375	
2	463.025	468.025	7	463.150	468.150
21	463.03125		71	463.15625	
22	463.0375		72	463.1625	
23	463.04375		73	463.16875

B. CTCSS Frequencies

Continuous Tone-Controlled Squelch (CTCSS) systems provide a reduction of nuisance interference in FM radio systems by incorporating a sub-audible tone onto the radio carrier information such that only a similarly equipped radio receiver will open its squelch circuit to receive the transmission. Systems equipped with CTCSS will eliminate much interference from distant sources, although CTCSS by itself cannot prevent undesired "FM capture" from occurring due to nearby simultaneous co-channel transmissions.

CTCSS frequencies are designated by the Telecommunications/Electronic Industries Association (TIA/EIA) in TIA/EIA Standard 603. The following table is a portion of those CTCSS frequencies above 90 Hz and below 211 Hz, which are approved for EMS radio communications in Florida. Since there is an abbreviated code scheme for these frequencies common to systems supplied by Motorola Communications & Electronics Inc., the Motorola (MOT.) code designations of these CTCSS frequencies are also shown. Similarly, the Wolfsberg (WOLF.) codes are also shown. Insofar as possible, CTCSS tones within a local geographic area should be exclusively from either Group A or Group B to avoid false sensing due to adjacent tone frequencies.

GROUP A

CTCSS FREQ (Hz)	MOT. CODE	WOLF. CODE
100.0	1Z	14
107.2	1B	16
114.8	2A	18
123.0	3Z	22
131.8	3B	24
141.3	4A	26
151.4	5Z	28
162.2	5B	32
173.8	6A	34
186.2	7Z	36
203.5	M1	38

GROUP B

CTCSS FREQ (Hz)	MOT. CODE	WOLF. CODE
94.8	ZA	12
103.5	1A	15
110.9	2Z	17
127.3	3A	23
136.5	4Z	25
146.2	4B	27
156.7	5A	31
167.9	6Z	33
192.8	7A	37
210.7	M2	--

Excluded from the above list are CTCSS frequencies below 90 Hz which may cause unacceptably long receiver response times in some systems, frequencies above 211 Hz which may require special engineering considerations in production, frequencies which would receive interference from common 60 Hz AC power systems, and non-TIA/EIA frequencies offered by some manufacturers which would limit interoperability.

3.2.2 Emergency Department Information

For each County, Emergency Department facilities are listed by geographic (rather than postal) address, followed by the 24-hour telephone number of either the switchboard (main), emergency department (E.D.), or both. The Emergency Department facilities listed information is provided by the State of Florida Agency for Health Care Administration Hospital and & Out Patient Services Unit.. EMS Channel usage shown for Emergency Departments within tables is current as of as possible. Specific Emergency Department MED channel allotments have been assigned to each Emergency Department facility and are shown beside each facility under the column titled "Med Channel Assignment." These channel allotments shall be in usage, if not already, by December 2004. Changes are not indicated in the margins for this information.

3.2.3 EMS Provider Information

Within each County, EMS Providers are listed alphabetically showing the telephone number of each provider. The State of Florida Department of Health Bureau of Emergency Medical Services provides this listing. Changes are not indicated in the margins for this information.

3.2.4 Statewide DTMF Addresses

Each county has been assigned a primary DTMF address. The DTMF address is listed with the name of each county. This list of primary DTMF addresses was derived from an alphabetical list of Florida counties compiled by the state EMS Office for reporting purposes. Changes are not indicated in the margins for this information.

3.2.5 EMS Air Transport Information

EMS Air-transporters are listed alphabetically by County showing the address and emergency phone and fax numbers for each agency. Radio channel information is also provided for each air agency.

Communications for aeromedical services may utilize certain radio frequencies within the Aviation Services of FCC Rules Part 87, "Aeronautical Enroute and Aeronautical Fixed Stations." The scope for Aeronautical Enroute stations is limited to the necessities of safety and primary operation of the aircraft. Sub-part I does not allow for medical communications. These channels are associated with Air-traffic Control Centers, Airport Control Towers and "Unicom" communications systems. By design these radio systems are limited in the communications coverage capabilities they would provide for low flying rotorwing aircraft. Given the limitations, by rule and/or design associated with these radio channels their use by prehospital for flight following is not acceptable for flight following.

Frequencies within the applicable FCC Rules may be utilized for Air Ambulance Dispatch and Response and/or Medical Coordination on a secondary basis to land-based systems. Licensing for implementation or expansion of air ambulance communications on any frequencies within the Public Safety or Special Emergency Radio Services requires prior approval by the STO. The EMS Communications Plan has established specific radio frequency allotments both "Air Primary" and "Air Secondary" within Florida for aeromedical Dispatch and/or Flight Following Communications.

Air Secondary

All licensed rotor-winged aircraft and dispatch centers within the state of Florida shall have the ability to communicate on the Air Secondary frequency 155.340 MHz with a CTCSS, PL tone, of 167.9 Hz. This provides continued flight following with the aircraft while medical crews utilize their UHF, MED Channel radio to provide medical reports (LMC, SMC or MRC). Secondly this circuit provides a "Statewide" radio system for MCI coordination with aircraft that would necessitate communications with the various aircraft, dispatch centers and/or landing zone management. Further, this frequency shall provide EMS helicopter personnel with continued safety of flight situations in which a vehicle is out of its prime area and unable to access its dispatch center. Such use of the Air Secondary channel shall be limited only to the temporary duration of such situations unless otherwise approved in writing by the STO.

4 INTERSTATE COORDINATION

4.1 GENERAL

Medical emergencies near the border of northern Florida often involve the mutual response of emergency medical service providers and hospital emergency departments in Alabama and/or Georgia. Interstate communications between providers and hospitals of all three states are necessary to support such EMS operations and mutual-aid agreements, as well as for wide-area mobilization of emergency response units during mass casualty incidents and disaster situations. This section (current as June, 2000) describes the VHF High Band portion of the EMS communications systems, radio frequencies and selective call addresses of hospitals and providers in the southernmost parts of Alabama and Georgia, which are readily accessible to providers and hospital emergency departments in the North Florida area.

4.2 Alabama

Each hospital has a specific radio dial code assigned to it. To access a hospital, select the appropriate channel; then dial the radio dial code of the desired hospital with an interrupted tone rotary dial encoder (HEAR/EACOM).

Table 4-1 lists the hospitals in adjacent counties in Alabama alphabetically by city.

5 HOSPITAL LATITUDE/LONGITUDE COORDINATES

This aeronautical information (Latitude/Longitude) is specifically designed to provide information for computer –based navigation system aboard aircraft. This data (current as June 1998) is not intended to be utilized for approach, landing, or departure operations. Coordinates were generated by LORAN-C, GPS, or VOR/DME calculations furnished by numerous Florida aeromedical providers. The State Technology Office makes no warranty, expressed or implied, as to the precision of this information and explicitly disclaims liability to the accuracy thereof. We suggest that you check Airman’s Information Manual, Airport/Facility Directory, NOTAMS, and/or Safety Bulletins for supplemental data and current information. Please notify the Office at (850) 922-6437 of corrections and additions to make this information more accurate
